Hi Gopichand,

Congratulations, Your profile has been shortlisted for the **Computer Vision Engineer profile** at **Wobot AI.**

As part of the selection process, you are required to undertake and complete the below-mentioned assignment.

Assignment details:
We want an application which reads a video file (e.g. mp4), takes a single region of interest (ROI) (as user input or hardcoded), and implements a timer running on the ROI for any vehicle that is present inside ROI. Keep track of each car and wait time over the duration of the run:

Output:
Processed frames from video should be written into an output mp4 file.

This output file should show,

- Detection bounding boxes
- ROI region
- Wait time printed on the frame (MM:SS, minutes:seconds)

General evaluation on:

- Dockerization
- OOPs concept usage
- Print visuals / metrics on output video
- Logging

Doc:

- Approach used, Design choices explained
- Recommendations to client for ideal setup
- Investigate edge cases and approaches to make the post processing in calculating the wait time (timer), more robust in general. (both if implemented within assignment and even if it's a suggestion).

Submission Process:
Compress all the folders/files (code, document, output) as a .zip and e-mail.

The deadline for completing the assignment will be 12th March 2026.

If there is any point that you need clarification on, feel free to contact me.

Wishing you all the best :)

Regards,

Rahul Singh
